Geospatial Information is data that describes the names and features on the surface of the Earth. These data layers can describe topographical features or more complex layers such as land-use and population density.

Geospatial Information supports a wide range of businesses, government agencies, community activities, and educational levels.

Often times Geospatial Information is used in what is known as a GIS (Geographic Information System). A GIS is a combination of computer software, hardware, GIS Users, and Geospatial Information (data). This dynamic combination aids in formulating decisions on the world around us. It is a powerful tool that allows us to see data visually, ask questions, and get answers to those questions quickly and easily.

WHY WYGEO?

The goal of WYGEO is to provide a forum for cooperation, coordination, education and the exchange of ideas, resources and technology and geospatial information in the state of Wyoming.

Through our quarterly and annual meetings we would also like to introduce this technology to people who may not be familiar with it. We encourage anyone interested to attend our meetings and to consider joining WYGEO.
